

Sachin Kumar

Product Engineer | iOS, macOS & AI Automation

Bengaluru, Karnataka, India | +91 9501841073 | sachinmehtab@gmail.com

linkedin.com/in/sachinkumar6174 | github.com/sachin6174 | sachinserver.in | leetcode.com/u/sachinkumar6174

WHAT I'VE SHIPPED

- **Shipped a product to the App Store alone** CodeForge, a native macOS and iOS coding IDE. Design, architecture, execution engine, tests, submission, App Review. No team, no PM, no designer.
- **Built a tool nobody asked for** that 20+ engineers and QA now use daily after noticing debugging turnaround was the team's biggest hidden cost.
- **Fixed a risk before it became a fire** migrated plaintext local storage to encrypted formats and retired deprecated libraries across a live fleet of 10,000+ devices, with zero breakage for users on older OS versions.
- **Automated my own job away where it was boring** local LLM and multi-agent workflows that verify builds and validate deployments so release sign-off stopped depending on human diligence.

SUMMARY

Product engineer, 3+ years, comfortable owning a problem from "this is vaguely broken" to shipped and monitored. Deep on Apple platforms (Swift, SwiftUI, UIKit, Swift Concurrency, system-level macOS), broad enough to have shipped a Chrome extension, a Next.js and Firebase AI product, and a full App Store release solo. I ship, measure, and cut the numbers below are all release-over-release deltas I own.

EXPERIENCE

42Gears Mobility Systems Pvt. Ltd.

February 2023 – Present

Bengaluru, India | Bootstrapped UEM SaaS | joined as intern, converted in 5 months

Product Engineer, iOS & macOS

July 2023 – Present

- Owned the macOS agent's concurrency rewrite start to finish audited the legacy GCD code, chose actor isolation over lock-based fixes, and migrated incrementally without a feature freeze, **cutting concurrency crash rates 40%**.
- Rebuilt the download pipeline after failure reports with no clear root cause: instrumented it, found partial-transfer loss, and shipped resumable chunked transfers with bounded worker queues, **cutting failure rates 35%**.
- Diagnosed and fixed a database bottleneck that had been treated as "just slow" reshaped the **Core Data** model, added indexes on hot paths, batched writes, **cutting lookup latency 50%**.
- Built privileged macOS system agents from scratch **LaunchDaemon** daemons, **XPC** IPC, privileged helpers, **NetworkExtension** traffic filtering now running on **10,000+ customer endpoints**.
- Shipped enterprise app install, upgrade, and uninstall flows (PKG/DMG) in Swift plus shell scripting, replacing a manual IT process end to end.
- Drove the MVVM to **VIPER** refactor of core modules so business logic could actually be tested, applying **SOLID** and dependency injection. *[CONFIRM: drove vs contributed]*
- Own my releases: **XCTest/XCUITest**, code signing, notarization, packaging, and **GitLab CI/CD** distribution. Nothing goes out that I did not test and ship myself. *[CONFIRM: XCTest ownership]*
- Shipped **Just-In-Time privilege escalation** and geofence and time-fence policy enforcement ambiguous compliance requirements turned into concrete, shippable product behaviour.
- Work directly with product, QA, and backend in weekly cycles; review teammates' code and onboard new engineers onto the macOS codebase. *[CONFIRM: mentoring/onboarding]*

iOS Engineer Intern

February 2023 – June 2023

- Shipped production features in **Swift**, **UIKit**, and **SwiftUI** within the first months; converted to full-time in 5 months.

THINGS I BUILT ON MY OWN

CodeForge Swift, SwiftUI, Swift Concurrency, JavaScriptCore solo

Live on the App Store

- A native macOS and iOS coding-practice IDE 5 practice tracks, an interactive test runner, a 2D matrix visualizer, and a **dual-path execution engine** (subprocess on macOS, **JavaScriptCore** on iOS) behind one protocol so both platforms share a test-runner core despite different sandbox rules.
- Fully offline, no backend, no server cost. Shipped through TestFlight and App Review without a team. *[ADD IF TRUE: downloads / rating / retention]*
- apps.apple.com/app/id6787703716 | github.com/sachin6174/SwiftForge

Agentic Gig Platform *Next.js, Firebase, Python, Kotlin, Google Cloud*

Top 700 of 57,000+ developers

- An AI agent platform giving farmers expert agricultural advice, built for the **Google Cloud Agentic AI Hackathon 2025** full stack, outside my usual language, under hackathon time pressure. github.com/abhikumar002/Agentic-Gig-Project

Secure Text *JavaScript, Chrome Extension APIs solo*

Published on Chrome Web Store

- Base64 and Base32 encoding utility, built and published to the Chrome Web Store. chromewebstore.google.com/detail/secure-text

TECHNICAL SKILLS

Deep: Swift, SwiftUI, UIKit, Swift Concurrency (async/await, actors), Core Data, macOS system programming (XPC, LaunchDaemon, NetworkExtension), CryptoKit/Keychain, App Store release

Working: Objective-C, C++, JavaScript, Python, Kotlin, Bash/Shell, SQL, Next.js, Firebase, REST APIs, SQLite, Google Cloud

How I work: Ship small and often, instrument before optimizing, write the test when it will actually catch something. XCTest, XCUITest, TDD, code review, Instruments profiling, Git, GitLab CI/CD, GitHub Actions, Fastlane, SPM, Agile

AI: Local LLMs, AI agents, multi-agent workflows, Core ML, prompt engineering, Claude Code, Cursor, GitHub Copilot used daily, in production, not as a demo

Architecture: VIPER, MVVM, Clean Architecture, SOLID, protocol-oriented design, dependency injection, modularization, system design

EDUCATION

Chandigarh Group of Colleges, Landran

August 2019 – May 2023

Bachelor of Engineering in Computer Science and Engineering CGPA: 7.9/10

Mohali, Punjab, India

ALSO

- *[ADD IF TRUE: N]*+ problems on LeetCode. Certified in System Design and Data Structures in C++. I write and tinker at sachinserver.in.
